

Text Generation Process

EASE: Entropy-Adaptive Distribution Shaping

- 1 Entropy-Adaptive Control**
Estimate decoding concentration and shaping strength.

Low entropy (concentrated)

High entropy (diffuse)

Low entropy large γ_t High entropy small γ_t
Entropy h_t

- 2 Token-Dependent Logit Modulation**
Generate context-dependent directions for promoting or suppressing candidate logits.

$$m_t^{(i)} = \sin(\omega_1 x_{t-1} + \omega_2 v_i + t)$$

- 3 Adaptive Distribution Shaping**
Jointly adjust token logits and sampling temperature using entropy-adaptive control.

γ_t
(from entropy)

$$\delta_t = \delta \gamma_t$$

larger $\gamma_t \rightarrow$ stronger perturbation

$$\tilde{\tau}_t = \tau + \beta \gamma_t$$

larger $\gamma_t \rightarrow$ higher temperature (more exploration)

Apply token-dependent logit offsets:

$$\tilde{l}_t^{(i)} = l_t^{(i)} + \delta_t m_t^{(i)}$$

AIGT Detector

Post-hoc evaluation only

Reduced detection confidence
